method for detecting oxygen and nitrogen in empty fuel tanks. The need for such a method comes from the potential danger of allowing explosive oxygen-fuel mixtures to accumulate in empty airplane fuel tanks.

# Online Library Fuel Tanks

An explosion resulting from such a mixture is believed to have caused the Flight TWA 800 disaster in 1996. Recently, (e.g., February 17, 2004 press release) the FAA announced its intentions to make fuel tank inerting

Twelve containers, proposed for shipping/storage of external fuel tanks, were subjected to outdoor storage environmental tests. The external fuel tanks were totally encapsulated in 2.0

p.c.f. rigid polyurethane foam. Opening of container was accomplished by using a tear wire prepositioned on the fuel tank prior to total encapsulation. From the results obtained it was concluded that the rigid

polyurethane foam gives adequate protection to external fuel tanks during unprotected storage and rough handling for a period of 3 years. Also, a tear wire opening of the container at an angle down

from the center line of the external fuel tank will provide a good closure without the use of a sealant.
